

Engineering Teardown of Agency Revolution and Levitate for Independent P&C Insurance Agencies

Platform positioning and module map

The clearest top-level difference is that Agency Revolution is built as an insurance-native, AMS-centered automation layer, while Levitate is built as a relationship-marketing platform that adapts into insurance through integrations, tags, key facts, and policy boards. Agency Revolution repeatedly positions Fuse as insurance marketing automation with “true AMS integration,” ready-to-launch campaigns, business texting, pipeline, and reputation management. Levitate positions itself around sending personal emails at scale from the user’s existing mailbox, using automations, content, and success specialists to keep client communication authentic. ¹

From an architecture and PRD standpoint, that means the products likely optimize around different primary objects:

- **Agency Revolution** is **account-first**. Public docs center segmentation on Account, Policy, Claim, and AMS/BMS fields; campaign audiences are built from account segments; producer/CSR data is injected into signatures and senders; and trigger points detect lifecycle changes by comparing synced policy/account states over time. ²
- **Levitate** is **contact-first**. Public docs center the Contact Profile, tags, key facts, ownership/connections, history, and data boards. Insurance policy data is attached to contacts through integrations or the Policy Board rather than exposed as a deeply account-centric event model. ³

A concise module comparison:

Module	Agency Revolution	Levitate
Email marketing	Broadcast emails, campaign sequences, content library, merge fields, signature components, sender/location logic, outbox review, analytics. ⁴	Template library, blank template creation, AI assistant, plain-text/group email model, HTML newsletters, custom fields as merge fields, follow-up cohorts, reporting. ⁵
SMS / texting	Business texting add-on, two-way texting inbox, Fuse campaign SMS steps, website chat widget, Twilio-backed setup, AMS writeback for supported systems. ⁶	One-to-one texting, text campaigns, text automations, 10DLC registration, per-number limits, business-hours guidance, reporting surface. ⁷
CRM / contact system	AMS-synced accounts, segments, account reps/producers, policy and claim fields, pipeline for leads/sales workflows. ⁸	Contacts, tags, key facts, ownership/connections, action items, policy board, household support, data boards. ⁹

Module	Agency Revolution	Levitate
Automation engine	Sequence-based engine with step sequences, date-field sequences, specific-date sequences, trigger points, segment-match automation, outbox override. ¹⁰	Automation canvas, date/event/tag/manual triggers, conditional branching, automation-to-automation chaining, multi-step mixed-channel flows. ¹¹
Campaign library	More than 30 predesigned campaigns, quick-start and clone/customize variants, insurance lifecycle focus. ¹²	Industry template library, featured content, blank creation, insurance templates plus shared/co-worker templates and plan-driven custom content. ¹³
Reporting	Email-focused analytics dashboard; business insights dashboard for book/policy performance; marketing calendar. ¹⁴	Email reporting with opens, clicks, replies, failed, unsubscribes, CSV; text/email automation progress; contact relationship analytics. ¹⁵

PRD implication: if you are building a “system of action” for independent P&C agencies, Agency Revolution is the closer analog for insurance event modeling, while Levitate is the closer analog for personal communication UX, sender reputation protection, and cross-channel relationship touches. The product to beat probably combines Agency Revolution’s insurance event depth with Levitate’s user-facing messaging ergonomics. ¹⁶

Messaging, automation, and UX teardown

Feature tree for Agency Revolution

- **Email**
- Broadcasts
 - One-off manual sends for office closures, natural disasters, timely announcements
 - File attachments
 - Segment-driven audience selection
 - Broadcasts separate from campaigns in analytics and calendar views. ¹⁷
- Campaign sequences
 - Sequence of steps
 - Date-field sequences
 - Relative to account or policy dates
 - Run once or repeat annually
 - Specific-date sequences
 - Relative to static dates
 - Run once or annually. ¹⁸
- Personalization
 - Merge fields in subject lines, buttons, images
 - Signature component can swap producer/CSR sender identity, photo, title, phone, website
 - Location-based sender/signature logic for multi-office agencies
 - Policy list component / active policy insertions

- Fallback merge values. 19
- Deliverability / compliance
 - Spam analysis and deliverability tools
 - Subscription preferences by content category
 - Generative-AI content categorization
 - Email blacklist, domain verification, DMARC guidance
 - Outbox manual approval before send. 20
- **SMS**
 - Two-way inbox
 - SMS steps in campaigns
 - Website chat widget
 - STOP-based opt-out
 - Twilio-backed provisioning and forwarding
 - Archiving after 14 days, with supported AMS writeback and optional AI-generated summaries. 21
- **Segmentation**
 - Account / Policy / Claim / AMS/BMS rule builder
 - Match All / Match Any logic
 - Relative date filters
 - Geo filters like multi-zip targeting
 - Segment export
 - AI assistant support for field discovery. 22
- **Automation**
 - Add audience At Launch / Ongoing / In The Future
 - Trigger points for account, policy, and claim events
 - Segment-match automation
 - Prebuilt quick-start campaigns
 - Custom campaigns cloned from library or built from blank. 23
- **Reporting**
 - Targeted, delivered, opens, clicks, unsubscribes, complaints
 - Campaign/broadcast table
 - CSV export
 - Calendar views for sent/scheduled email and text
 - Business insights around active customers, policies in force, and performance. 24

Feature tree for Levitate

- **Email**
 - Library-driven group emails
 - Search by keyword, industry, category
 - Preview, edit, schedule
 - Hard end date for time-sensitive sends. 25
 - Blank template creation
 - AI-assisted drafting
 - Shared internal templates
 - HTML newsletters as separate asset type. 26
 - Personalization
 - Merge fields, including custom fields
 - Media insertion: links, images, GIPHY GIFs, YouTube thumbnails, attachments

- Subject-line merge fields supported
- Some integration-specific merge fields on newer pipelines. ²⁷
- Deliverability / compliance
 - Sends through user's existing mailbox, not a shared blast server
 - Automatic validation of email addresses on first group send
 - "Email Bounced" tagging and auto-removal of undeliverables
 - Account-wide 5,000-emails-per-24-hours cap
 - Per-provider safeguards such as 30-second buffers and business-hours sending
 - Unsubscribe footer and physical address requirements for commercial emails. ²⁸
- **SMS**
- One-to-one texting
- Text campaigns
 - Recipient selection by tag group or individually
 - Scheduling now or later
 - Draft support
 - Recipient narrowing by key fact through advanced filter
- Text automations
- 10DLC/upstream-carrier registration
- Default 250 texts per number per day, with raise-by-request
- STOP/unsubscribe support. ²⁹
- **Contact system**
- Contact profiles with tags, key facts, history, ownership/connections
- Keep-in-touch reminders and relationship analytics
- Data boards for policies/opportunities/donations
- Household support through household key facts. ³⁰
- **Automation**
- Date-based triggers
 - Birthday
 - Turning age
 - Renewal
 - Meeting reminders
- Event-based triggers
 - New lead
 - New donor / donation
 - New policy
- Tag-triggered flows
 - Optional cooldown period
- Manual automations
- Steps
 - Email
 - HTML newsletter
 - Text
 - Action item
 - Add tag / delete tag
 - Handwritten card
- Visual automation canvas
 - Conditional branching
 - One automation can kick off another. ³¹

- **Reporting**

- Email opens, clicks, replies, failures, unsubscribes
- CSV exports
- Follow-up sends to behavioral cohorts
- Email/text automation progress with pending and completed states
- Open-rate guidance that replies matter more than opens. ³²

Observed UX patterns

Agency Revolution's UX is campaign-builder heavy: create sequence type first, choose audience and enrollment timing second, then define steps and triggers, then optionally route through Outbox for approval. That is a classic insurance automation build path and feels closer to a workflow engine than a newsletter tool. ³³

Levitte's UX is messaging-first: pick contacts or board rows, choose a template or AI draft, personalize, schedule, and rely on tags/key facts/automations to keep the process contextual. The newer Automation Canvas adds more workflow depth, but the product still feels designed to make every send look like a personal follow-up rather than an industrial campaign. ³⁴

Step-by-step workflow deconstruction

Broadcast campaign

1. Agency Revolution: select segment or audience, open Broadcast Email, build email from components, attach files if needed, send immediately; analytics later lands in Marketing Analytics and calendar views. ³⁵
2. Levitate: select contacts from Contacts or Data Board, open Campaign/template flow, preview or draft content, insert merge fields/media, schedule now or later, optionally set end date. ³⁶

Drip / nurture campaign

1. Agency Revolution: Marketing → Custom Campaigns → Create New Campaign → Blank Campaign or clone from library → Create Sequence → choose sequence type → choose audience segment → choose At Launch/Ongoing/In The Future → configure steps → launch. ³⁷
2. Levitate: create automation or schedule a campaign sequence around a date or event; newer canvas supports visible step layout, branching, and chaining; steps can mix email, text, tasks, tags, and cards. ³⁸

Trigger-based renewal campaign

1. Agency Revolution: build a date-field sequence anchored to expiration or next-renewal date, or use policy triggers like Renewed Policy / Policy Premium Rate Change; audience can enroll in the future when trigger logic detects the event. ³⁹
2. Levitate: renewal key facts from integrations or policy board drive dashboard cards and renewal automations; users can launch from a dashboard card or automation if key facts are present. ⁴⁰

Insurance workflows and AMS behavior

Agency Revolution exposes much more of the insurance event model publicly. Its automation engine detects account and policy lifecycle changes such as New Customer, New Bound Customer, Lost Customer, New Prospect, Reinstated Customer, Lost Policy, New Quoted Policy, Each New Policy, First New Policy, Additional Policy, Renewed Policy, Policy Premium Rate Change, New Claim, and Closed Claim. Public docs even describe the logical conditions behind those detections. That is unusually close to a real underwriting/servicing event bus for a marketing layer. ⁴¹

Levitate exposes fewer insurance-native triggers, but it clearly supports insurance lifecycle messaging through AMS-derived tags and key facts, Renewal Automations, birthday/turning-age outreach, new lead automation, and a newer New Policy Automation. The product appears to rely more on policy data being normalized into contact-level attributes rather than on broad policy state-diff logic. ⁴²

Lifecycle support by use case

Workflow	Agency Revolution	Levitate
New lead	Website forms, form-follow-up campaigns, pipeline, segmentation, and new-prospect logic. ⁴³	Lead Parser-driven New Leads Automation and contact-centric follow-up. ⁴⁴
Quote generated	Stronger native signal: New Quoted Policy trigger, though not on every AMS. ⁴⁵	No public insurance quote-state trigger found in current docs; likely handled via imports/tags or external process. Supported evidence is weaker. ⁴⁶
Bound policy	New Bound Customer trigger. ⁴⁷	New Policy Automation and policy-added events. ⁴⁸
Renewal upcoming	Date-field sequences anchored to renewal/expiration; renewal-campaign guides by AMS. ⁴⁹	Renewal key facts, dashboard cards, renewal automations, policy board date filters. ⁵⁰
Cross-sell	Prebuilt Auto→Home, Home→Auto, Personal→Umbrella, Commercial→Workers Comp, Commercial→Personal, Personal→Life. ⁵¹	Insurance template examples and policy-board filtering can support cross-sell, but public docs show less native productized depth. ⁵²
Lapsed policy / win-back	Lost Customer and Lost Policy triggers; win-back campaigns. ⁵³	Could be approximated by tags, status changes, or manual board logic; no public lost-policy automation equivalent found. ⁵⁴
Claims follow-up	Explicit claim segmentation and New Claim / Closed Claim triggers. ⁵⁵	No public claims board or claim-triggered automation in insurance docs. Research did not surface a first-class claims workflow. ⁵⁴

AMS integration deconstruction

Insurance AMS integrations center on data from Applied Systems ⁵⁶, Vertafore ⁵⁷, and messaging infrastructure from Twilio ⁵⁸. Publicly observable integration patterns are different enough that they matter to system design. ⁵⁹

Agency Revolution

- **Applied Epic:** public setup docs revolve around custom Client List and Policy List reports, plus ongoing uploads or automatic report delivery. Policy-level sending can use servicing roles when the sequence has policy context. Epic-specific docs also show policy-level renewal campaigns and marketing-preference usage. ⁶⁰
- **Vertafore AMS360:** public docs clearly show policy renewal campaign support, policy premium calculations, AMS360 action-name customization, and activity sync surfaces. The exact public field list is less centralized than Levitate's, but the exposed operations imply account, policy, premium, renewal, and action/writeback data. ⁶¹
- **EZLynx:** the integration is report-driven. Required inputs are Applicant Master, Policy Master, and Policy Transaction Master reports, with an optional claims report. Baseline sync uses up to five years of exported data; ongoing sync is nightly via scheduled emailed reports. ⁶²
- **Writeback:** public docs clearly show AMS writeback for archived text conversations and summaries on supported systems such as AMS360, HawkSoft, and QQ Catalyst. Public evidence for universal email-writeback is less explicit than Levitate's. ⁶³

Levitate

- **Applied Epic:** daily scheduled-report ingestion; pulls first/last name, address, email, company, birthdays, policy renewal date, client/prospect tag, and policy tags; does **not** write back to Epic. ⁶⁴
- **Vertafore AMS360:** real-time sync; pulls contact info, nickname, phone, company, job title, birthdays, AMS360 client ID, policy renewal date with carrier details, and tags for client/prospect, policies, carrier, health flag, and AE/rep initials. It can also pull notation/division/department/branch/group and second insured, and it writes back notes, emails, logged phone calls, cards, and texts. ⁶⁵
- **EZLynx:** daily scheduled-report ingestion; pulls nickname, phone, job title, birthdays, policy renewal date, client/prospect, policies, city/state/zip tags, and does **not** write back to EZLynx. It only pulls primary contacts. ⁶⁶
- **QQCatalyst:** daily sync; pulls contact info, birthdays, active-policy expiration dates, line-of-business tags, carrier tags, agent/CSR tag, customer ID tag, and policy source tag; it can push emails, notes, and texts back to QQ Catalyst. ⁶⁷

What data is actually used in campaigns

Agency Revolution's public segmentation categories prove that campaigns can target account status, address/email, policy counts/types/premium, claim data, and AMS-specific fields such as billing method, department/division codes, and account rep. Its partner pages state communications can be based on "over 100 data points." That is the profile of a rules-heavy audience and event model. ⁶⁸

Levitate's insurance docs show policy and AMS data being translated into **tags** and **key facts**. In practice, that means most insurance workflows are implemented through filters like client/prospect, line of business, carrier, renewal date, owner/connection, and key dates, then routed into campaigns, text campaigns, or

automations. The Policy Board extends that with premium, commission, policy CSR, policy producer, carrier, line of business, and renewal-date filters. ⁶⁹

Data model and automation execution

Likely normalized data schema

The schema below separates what is directly observable from what is inferred.

Entity	Agency Revolution	Levitate
Primary party object	Account with primary/secondary contacts, policies, claims, reps/producers. This is explicit in segment categories and campaign audience logic. ⁷⁰	Contact with ownership, connections, tags, key facts, history, and linked policy-board rows. This is explicit in contact profiles and policy board docs. ⁷¹
Household	Likely represented implicitly by personal account plus secondary contacts; public docs emphasize primary/secondary contact behaviors more than first-class household modeling. ⁷²	Explicitly supported through Household key facts connecting two spouses/partners; some external integrations can also map households. ⁷³
Policy	Client type, policy type(s), number, inception date, effective date, expiration date, plus premium/renewal state and event history. ⁷⁴	Policy holder, owner, line of business, carrier, premium, policy number, effective date, renewal date, commission, CSR, producer. Required fields for create/import are owner, effective date, and renewal date, with holder identity required for association. ⁷⁵
Carrier	At least available in claim/policy contexts and some AMS-specific merge fields. ⁷⁶	Explicit tag and board field; also part of AMS360 renewal key facts and policy tags. ⁷⁷
Agent / user	Producer, CSR, Account Rep, policy servicing role, location sender. ⁷⁸	Contact owner, connections, policy owner, policy CSR, policy producer, selected user assignee for action items. ⁷⁹
Communication history	Campaign emails, broadcasts, texts, postcards, outbox states, AMS text writebacks. ⁸⁰	Emails, texts, notes, phone calls, cards in contact history; writebacks on selected AMS integrations. ⁸¹
Custom metadata	Segments, AMS/BMS fields, location maps, email categories, tags. ⁸²	Tags, key facts, up to 25 custom fields, custom dashboard cards; custom fields are mergeable but not searchable. ⁸³

Key automation primitives

Agency Revolution's execution model is best understood as:

1. **Ingestion** from AMS via API or scheduled report/email upload.
2. **Normalization** into account/policy/claim structures.
3. **Diffing current sync vs. prior sync** to derive trigger points.
4. **Audience enrollment** through At Launch / Ongoing / In The Future logic.
5. **Sequence scheduling** using step sequences or date sequences.
6. **Optional human approval** through Outbox.
7. **Delivery + analytics** for email, plus texting/postcard surfaces on separate channels. This is an inference, but it is strongly grounded in the documented trigger logic, sync behavior, and outbox design. ⁸⁴

Levitte's execution model is best understood as:

1. **Ingestion** from integration, spreadsheet, lead parser, or policy board.
2. **Normalization** into contacts, tags, key facts, ownership, and board rows.
3. **Automation trigger binding** on key dates, tags, events, and manual launches.
4. **Canvas compilation** into ordered per-contact jobs, including branches and automation chaining.
5. **Channel send orchestration** through mailbox-based email and registered texting numbers.
6. **Stateful progress tracking** against send limits and pending queues. This is also an inference, but it is directly supported by the visible trigger catalog, step catalog, canvas behavior, and queued send-limit handling. ⁸⁵

Engineering system implications

A product intended to surpass both platforms will need these core services:

- **Data ingestion layer** that can support API connectors, scheduled report ingestion, CSV imports, and webhook/Zapier ingestion. Agency Revolution proves report-ingestion still matters in insurance; Levitate proves spreadsheet and lighter connectors still matter for account coverage. ⁸⁶
- **Insurance normalization layer** that models account, household, person, policy, carrier, claim, producer/CSR, and relationship roles. Agency Revolution's account/policy/claim granularity is the stronger benchmark. ⁸⁷
- **Event bus / trigger detector** that can process both state transitions and date-centered reminders. The strongest pattern is "sync → normalize → diff → emit business events." ⁸⁸
- **Audience and suppression engine** that supports tags, segments, AMS fields, opt-outs, bounce suppression, and channel-level consent. Both vendors have parts of this; neither publicly documents a truly unified consent model across policy, email, and SMS. ⁸⁹
- **Messaging engine** with mailbox-based email options, SMS provider abstraction, rate controls, business-hours support, and deliverability tooling. Levitate is stronger on mailbox-based email; Agency Revolution is stronger on Twilio ownership and AMS-linked texting. ⁹⁰
- **Workflow engine** that combines Agency Revolution's insurance event vocabulary with Levitate's canvas, branching, and mixed-channel steps. ⁹¹

Reporting, campaign content, limits, and observed gaps

Campaign library and content strategy

Agency Revolution's public library is much more insurance-productized. It explicitly ships welcome kits, account reviews, cross-sell campaigns, lost-customer win-back, cyber liability outreach, disaster preparedness, referral thank-you, birthday flows, and renewal guides by AMS. Quick Start variants are turnkey and sometimes non-editable; clone/customize variants are intended for agency-specific tuning. ⁹²

Levitate's library is broader and more editorial. Users search by industry/category, preview and edit templates, create blank drafts, and can rely on a success specialist plus AI assistant. Insurance examples on the public site emphasize check-ins, bundling prompts such as "Home, No Auto," renewal reminders, and review/referral nurturing rather than highly explicit policy-state campaigns. The top-tier plan adds a full custom content calendar. ¹³

Reporting profile

Agency Revolution's reporting is clearly email-centric: targeted, delivered, opens, clicks, unsubscribes, and complaints, plus campaign/broadcast exportability. The Marketing Calendar also visualizes scheduled and sent texts and emails, but the Marketing Analytics dashboard explicitly excludes texts and postcards. That means channel analytics are not fully unified in the public reporting layer. ⁹³

Levitate's reporting is stronger at campaign follow-up and recipient-level re-engagement. It tracks viewed/opened, replied, failed, clicked, and unsubscribed contacts, supports CSV export, and allows follow-up sends to behavioral cohorts such as "did not reply," "clicked," or "did not open." It also exposes queue/pending states for automations when send limits are reached. At the same time, Levitate's own help docs caution that open rates are approximate and that reply rate is the better engagement measure. ⁹⁴

Notable operational limits

- Agency Revolution texting is intentionally conservative. Its guidance says texting should be transactional/event-driven, limited in frequency, sent only during business hours, and should not be blasted to all clients. That is good compliance hygiene, but it also makes the text channel feel narrower than email. ⁹⁵
- Levitate enforces explicit send limits: 5,000 emails per account per 24 hours and 250 texts per number per day by default, with nightly resets and queueing behavior. ⁹⁶
- Levitate custom fields are usable as merge fields but are not searchable/filterable, which is a significant limitation for an insurance operating system where custom underwriting/service metadata often becomes the segmentation backbone. ⁹⁷
- Levitate documents that Renewal Automations do **not** respect the Unsubscribe tag, while birthday automations do. That is a consequential edge case for compliance and preference modeling in insurance communications. ⁹⁸

Gaps that matter for a system-of-action build

The largest observable gaps are these:

1. **Neither product publicly demonstrates true policy-attributed conversion reporting.** Agency Revolution surfaces business insights and email metrics; Levitate surfaces campaign and contact metrics. Neither publicly documents a model that says "this renewal email led to bound premium X" or "this cross-sell workflow created policy Y." ⁹⁹

2. **Agency Revolution's branching/workflow ergonomics appear weaker than Levitate's.** It is powerful, but public docs expose a rules-and-sequence engine rather than a modern visual canvas with conditional branches. ¹⁰⁰
3. **Levitate's insurance data model appears shallower than Agency Revolution's.** Levitate's insurance behavior is heavily tag/key-fact driven, whereas Agency Revolution exposes account/policy/claim events and deeper AMS/BMS field targeting. ¹⁰¹
4. **Self-serve configurability is incomplete in both products.** Agency Revolution still depends on AMS setup/report plumbing; Levitate frequently routes capabilities through a success specialist or support for custom fields, dashboard cards, branding, and some merge-field or integration settings. ¹⁰²

Onboarding and pricing signals

Agency Revolution's onboarding is integration-heavy; one setup doc says the initial AMS data download can take roughly four to eight hours after required setup, and some connectors still require report building, emailing, file-size management, or manual uploads. A public add-on page lists "Do It For Me" concierge marketing at **\$400/month**, which implies a services-assisted monetization model layered on the core platform. ¹⁰³

Levitate publishes feature tiers—Essential, Preferred, and Prestige—but not public self-serve prices on the plans page; the FAQ says pricing is customized. Every plan emphasizes a dedicated success specialist, which suggests a high-touch onboarding and retention model rather than a pure product-led one. ¹⁰⁴

Opportunities, user stories, and build blueprint

Highest-impact differentiation opportunities

The opportunity set below is based on the documented strengths and gaps above.

Opportunity	Customer value	Engineering complexity	Why it wins
Unified insurance event bus for quote, bind, issue, cancel, rewrite, rewrite-to-new-carrier, lapse, claim open/close, endorsement, and payment delinquency	Very high	High	Goes beyond Agency Revolution's visible trigger catalog and well beyond Levitate's tag/key-fact model
Policy-attributed communication reporting	Very high	High	Lets agencies prove ROI in bound premium, retention, and cross-sell terms
Account + household + contact hybrid model	Very high	Medium	Fixes the account-first vs contact-first split and supports personal + commercial agencies

Opportunity	Customer value	Engineering complexity	Why it wins
Visual automation canvas with insurance-native nodes	Very high	Medium	Combines Levitate's UX with Agency Revolution's insurance depth
Channel-native consent and preference center	Very high	Medium	Needed for compliance, especially because current products show edge cases and fragmented opt-out behaviors
Self-serve AMS mapping debugger	High	Medium	Reduces onboarding friction and specialist dependence
Send-time optimization by policy window and client behavior	High	Medium	More useful than generic marketing send optimization in insurance
Producer/CSR routing with role fallbacks	High	Medium	Critical for personal-feeling communication in servicing-heavy agencies
Claims workflows with NPS, review request, and service recovery branches	High	Medium	Agency Revolution hints at claims; neither publicly shows a best-in-class closed-loop claims journey
Conversion-aware cross-sell recommender	High	High	Uses coverage gaps, household assets, and lifecycle context to prioritize campaigns
Inbox-based email plus domain-warmed bulk rail	High	High	Marry Levitate's personal inbox model with scalable deliverability controls
Omnichannel outbox / approval queue	Medium	Medium	Extends Agency Revolution's Outbox concept to email, text, cards, and tasks
Searchable custom-field schema with type system	Medium	Low	Fixes a real Levitate limitation and becomes critical for operations
Policy timeline UI	Medium	Medium	Visualizes policy history, communications, and agent actions on one record
Renewal cockpit with competitor-offer defense	High	High	Gives the agency a pre-renewal action center rather than isolated campaigns

Engineering-ready user stories

As an independent insurance agent, I want a renewal workflow that enrolls a client automatically when a policy enters a 60-day renewal window so that I can defend retention without manually building lists.

Acceptance criteria: workflow can target by account, policy, line of business, carrier, producer, and channel consent; it must stop or reschedule when a policy renews early; it must support email, SMS, task creation, and follow-up branching.

Edge cases: early renewal, rewritten policy number with same risk, duplicate policies in package accounts, missing email but valid SMS.

Dependencies: policy effective/expiration dates, active/inactive logic, producer mapping, consent store, event bus. Supported need is visible in Agency Revolution's renewal/date-sequence logic and Levitate's renewal key facts/automations. 105

As an agency principal, I want policy-attributed reporting so that I know which communications generated retained premium, new policies, and cross-sell revenue.

Acceptance criteria: every campaign/report can display touched accounts, converted policies, premium retained or won, and time-to-bind; exports available by producer and line of business.

Edge cases: multiple touches before bind, multiple policies on same account, assisted conversions through manual calls.

Dependencies: communications ledger, attribution model, policy/version history, source-of-truth integration. No current public docs show this end-to-end. 106

As a CSR, I want one customer record that combines household members, active policies, claims, key dates, and communication history so that I can act without switching systems.

Acceptance criteria: record supports personal and commercial accounts; shows primary/secondary/household relationships; supports filters on history by channel and policy.

Edge cases: household split, commercial insured with multiple contacts, deceased secondary contact, merged duplicates.

Dependencies: account-household-contact model, relationship service, communication ledger. The need emerges because Agency Revolution is account-centric while Levitate is contact-centric. 107

As a producer, I want cross-sell recommendations generated from missing lines and household/business context so that I can prioritize the best next conversation.

Acceptance criteria: system surfaces "Home no Auto," "Commercial no Workers Comp," "Personal no Umbrella," and configurable agency-defined gaps.

Edge cases: policy mapped under nonstandard AMS line names, inactive policies, package/bundled business.

Dependencies: policy normalization, line-of-business mapping, recommendation job, UI ranking. Existing campaigns show the baseline opportunity. 108

As a compliance manager, I want a unified consent engine for email, SMS, and mandatory service notices so that opt-outs are respected without accidentally suppressing essential servicing messages.

Acceptance criteria: separate marketing vs service transactional categories; contact-level and household-level suppressions; audit log; channel-specific STOP and unsubscribe events.

Edge cases: renewal notices classified as service vs marketing, one spouse opts out, phone STOP with email

still allowed.

Dependencies: consent store, delivery middleware, category taxonomy. This is especially justified by Agency Revolution's category preferences and Levitate's renewal/unsubscribe edge case. 109

As an operations admin, I want a self-serve integration console that shows which AMS fields are mapped, which reports failed, and what events were derived so that onboarding and troubleshooting do not depend on support.

Acceptance criteria: view sync health, last successful job, missing required fields, unmapped lines of business, event audit trail, writeback status.

Edge cases: file-size failure, report not emailed, field rename in AMS, partial branch access.

Dependencies: connector framework, sync logs, mapping metadata, replayable event derivation. The need is visible in current report-based and specialist-led onboarding. 110

As a service team lead, I want an omnichannel approval queue for high-risk automations so that new campaigns can be audited before they go fully live.

Acceptance criteria: queue supports email, SMS, tasks, and cards; manager can approve, reject, bulk approve, or auto-approve after confidence thresholds.

Edge cases: item expires, user edits step after approval, policy state changes while queued.

Dependencies: job state machine, reviewer roles, audit trail. Agency Revolution's Outbox proves demand for this pattern. 111

As a growth leader, I want communication performance broken out by producer, CSR, office, line of business, and campaign type so that I can coach the team and scale what works.

Acceptance criteria: dashboards support filters, cohort exports, and side-by-side comparisons over time; include booked meetings, replies, and policy outcomes.

Edge cases: shared ownership, office reassignment mid-period, deleted campaigns.

Dependencies: dimensional analytics warehouse, normalized user and office dimensions. Existing products expose partial slices only. 99

Recommended build blueprint

A superior product should be designed around six services:

1. **Connector service** for API, report-email, CSV, and webhook ingestion.
2. **Insurance graph / normalized warehouse** for account, household, contact, policy, carrier, claim, role, and coverage-gap objects.
3. **Event engine** that computes lifecycle events from diffs, dates, and explicit source-system activities.
4. **Workflow engine** with visual canvas, typed nodes, branch conditions, retries, approvals, and automation chaining.
5. **Messaging service** that supports mailbox-based email, bulk email, SMS provider abstraction, consent enforcement, and rate limiting.
6. **Attribution and analytics layer** that joins communications to policy outcomes and agency KPIs.

This blueprint is the synthesis of the strongest patterns documented across both products. 112

Scalability and technical challenges

The hardest parts will not be the email editor or SMS composer. They will be:

- **Insurance data normalization across messy AMSEs** where line-of-business names, status mappings, and role structures differ materially. ¹¹³
- **Reliable event derivation** when sources are report-based, delayed, partially real-time, or overwrite prior policy states. Agency Revolution explicitly warns that overwriting old policies can break event logic. ¹¹⁴
- **Consent and deliverability enforcement** across mailbox sends, bulk sends, and SMS. Levitate's send-limit, validation, and buffer model is a good baseline; Agency Revolution's conservative SMS guidance is also worth preserving. ¹¹⁵
- **Attribution correctness** because policy changes can happen through multiple channels and sometimes outside the marketed system. That will require event time windows, source weighting, and explicit "assisted conversion" handling. The absence of this publicly in both products is itself a signal that it is difficult and differentiating. ¹⁰⁶

Bottom line

If the goal is to reverse-engineer these products into a buildable PRD, the most important conclusion is this: Agency Revolution is the stronger reference for **insurance entity modeling, lifecycle triggers, and AMS-linked campaign enrollment**, while Levitate is the stronger reference for **human-feeling messaging UX, direct-inbox delivery, canvas-style automations, and follow-up reporting**. The winning product for independent P&C agencies should not copy either one literally; it should fuse Agency Revolution's insurance-native event engine with Levitate's communication ergonomics, then add first-class attribution, household-aware modeling, and self-serve integration observability. ¹¹⁶
